THAI METEOROLOGICAL DEPARTMENT

Presently, various advances of weather radar technology including dual polarization Doppler are implemented in NHMSs operation.

With the limitation of local observation range maximum hundred kilometers for S-band, C-band and X-band.

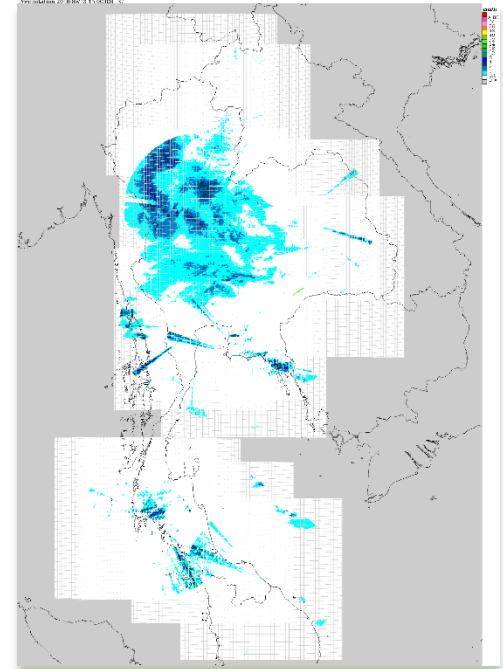

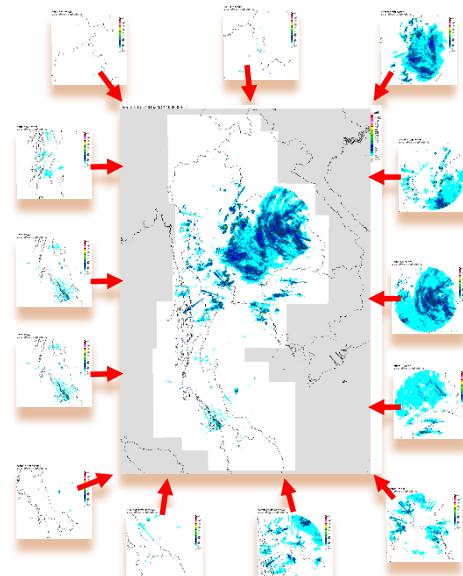

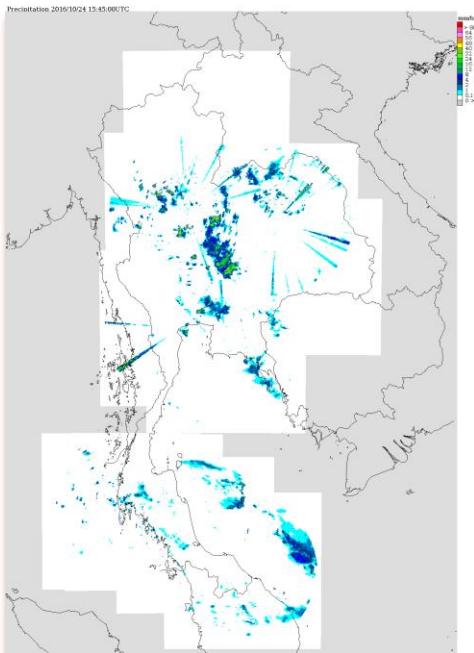

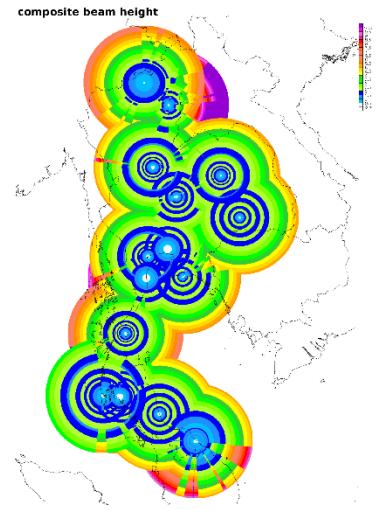

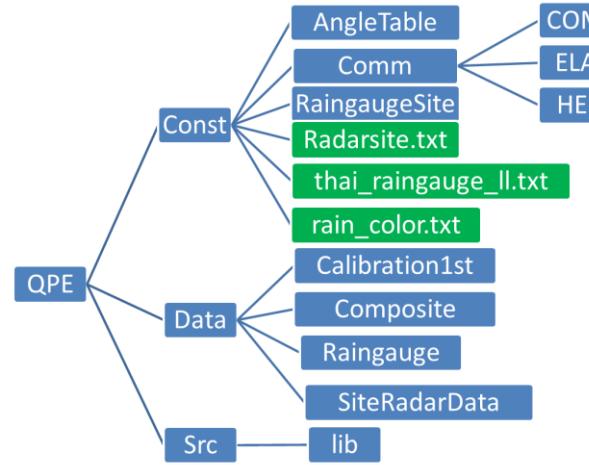

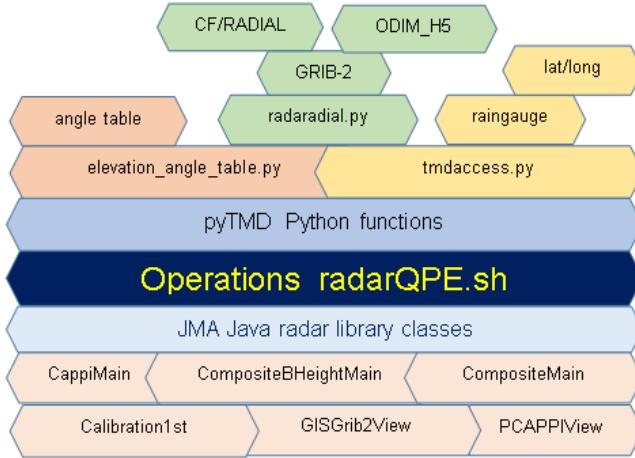

Some time, it is impossible to observe severe phenomena that will occur and affect to resilient areas for alerting, early warning, and preparedness in advance.

Summary

The weather radar composite or mosaic is one of the application that gives more information in both of temporal and spatial resolution

The sever weather occurred in the Southern part of Thailand is shown the development of active low and clarify especially position and movement.

These results will be more useful for advisories to the decision maker on disaster warning and preparedness in each situation
